▶ About the Lab

These lab notes are to support the instructional videos on AWS VPC architecture in the BackSpace AWS Certified Solutions Architect Associate course.

This lab is the culmination of many aspects of AWS Architecture that you have learnt throughout the course. The focus will be on ensuring all the concepts essential for certification are clearly understood.

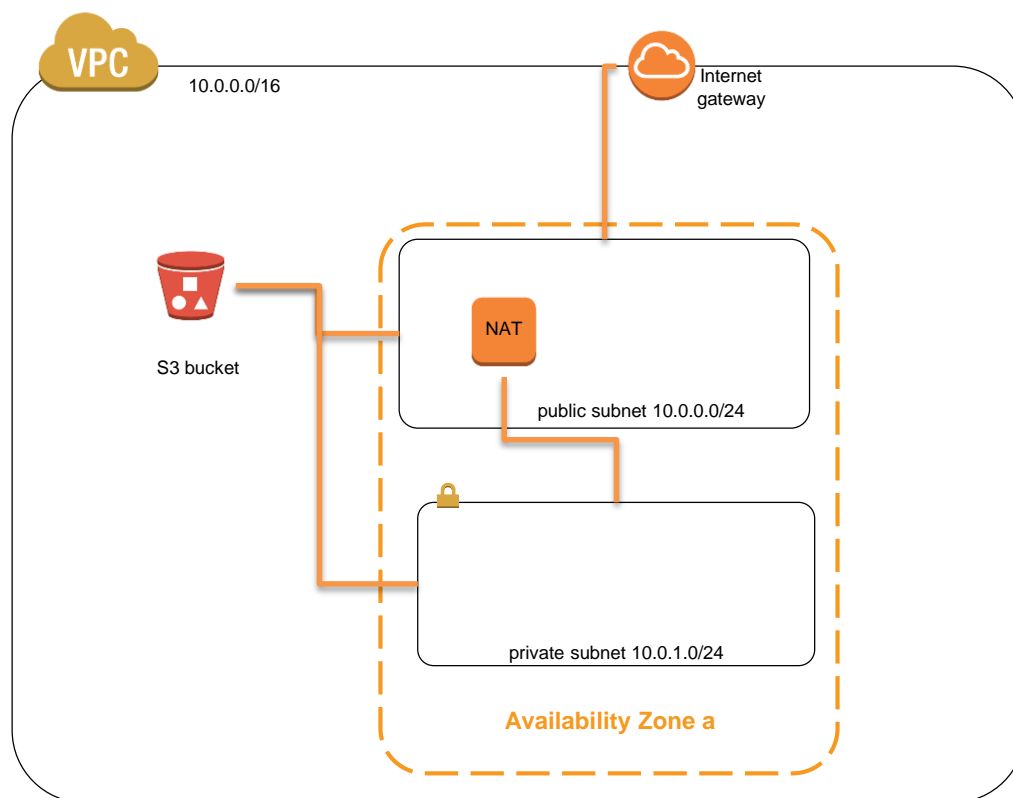

The architecture we will be developing detailed in the diagram below is typical for a web application such as a WordPress site.

Please note that AWS services change on a weekly basis and it is extremely important you check the version number on this document to ensure you have the latest version with any updates or corrections. The videos may not be as current as these lab notes so please follow these lab notes carefully.

Creating a VPC with Public and Private Subnets and a NAT Instance

In this section we will use the VPC Wizard to create a VPC with public and private subnets and, a NAT instance to allow instances in the private subnet to download updates from the Internet. We will then look at improving the security of the VPC.

Make sure you are in US-East region and select the VPC console

The screenshot shows the AWS VPC Dashboard. The left sidebar contains navigation links for Virtual Private Cloud, Subnets, Route Tables, Internet Gateways, DHCP Options Sets, Elastic IPs, Endpoints, Peering Connections, Security, Network ACLs, Security Groups, VPN Connections, Customer Gateways, Virtual Private Gateways, and VPN Connections. The main content area is titled 'Resources' and shows a list of resources for the selected VPC. The 'Service Health' section on the right shows the status of Amazon VPC and Amazon EC2 services, both of which are operating normally. The 'Additional Information' section provides links to VPC Documentation, All VPC Resources, Forums, and Report an Issue.

VPC Dashboard

Filter by VPC: None

Resources

Note: Your instances will launch in the US East (N. Virginia) region.

You are using the following Amazon VPC resources in the US East (N. Virginia) region:

Resource Type	Count
1 VPC	1
4 Subnets	1
1 Network ACL	0
1 Security Group	0
0 VPC Peering Connections	0
0 VPN Connections	0
0 Endpoints	0
1 Internet Gateway	1
1 Route Table	0
0 Elastic IPs	0
0 Running Instances	0
0 Virtual Private Gateways	0
0 Customer Gateways	0

VPN Connections

Amazon VPC enables you to use your own isolated resources within the AWS cloud, and then connect those resources directly to your own datacenter using industry-standard encrypted IPsec VPN connections.

VPN Connections	Customer Gateways	VPC ID	Status
You do not have any VPNs.			

Service Health

Current Status	Details
Amazon VPC - US East (N. Virginia)	Service is operating normally
Amazon EC2 - US East (N. Virginia)	Service is operating normally

[View complete service health details](#)

Additional Information

[VPC Documentation](#)
[All VPC Resources](#)
[Forums](#)
[Report an Issue](#)

Click "Start VPC Wizard"

The screenshot shows the 'Step 1: Select a VPC Configuration' screen of the AWS VPC Wizard. It presents four configuration options in a list on the left. The first option, 'VPC with a Single Public Subnet', is highlighted. The main content area provides details about this configuration, including a diagram showing a public subnet connected to the Internet. The 'Select' button is visible at the bottom right.

Step 1: Select a VPC Configuration

VPC with a Single Public Subnet

Your instances run in a private, isolated section of the AWS cloud with direct access to the Internet. Network access control lists and security groups can be used to provide strict control over inbound and outbound network traffic to your instances.

Creates:

A /16 network with a /24 subnet. Public subnet instances use Elastic IPs or Public IPs to access the Internet.

[Select](#)

Diagram: A cloud icon labeled 'Internet, S3, DynamoDB, SNS, SQS, etc.' is connected to a box labeled 'Public Subnet', which is part of the 'Amazon Virtual Private Cloud'.

Select "VPC with Public and Private Subnets"

Step 1: Select a VPC Configuration

VPC with a Single Public Subnet

VPC with Public and Private Subnets

VPC with Public and Private Subnets and Hardware VPN Access

VPC with a Private Subnet Only and Hardware VPN Access

In addition to containing a public subnet, this configuration adds a private subnet whose instances are not addressable from the Internet. Instances in the private subnet can establish outbound connections to the Internet via the public subnet using Network Address Translation (NAT).

Creates:

A /16 network with two /24 subnets. Public subnet instances use Elastic IPs to access the Internet. Private subnet instances access the Internet via a Network Address Translation (NAT) instance in the public subnet. (Hourly charges for NAT instances apply.)

Select

Give the VPC a name.

Select us-east-1a for both subnets.

Call the subnets Public subnet 1 and Private subnet 1

Select “Public and Private” subnet for “Add endpoints for S3 to your subnets”. This allows instances in your subnets to directly access an S3 bucket in the same region. This can be used to bootstrap instances with latest code from a Git repository.

Click “Create VPC”

Step 2: VPC with Public and Private Subnets

IP CIDR block: 10.0.0.0/16 (65531 IP addresses available)

VPC name: backspace-lab

Public subnet: 10.0.0.0/24 (251 IP addresses available)

Availability Zone: us-east-1a

Public subnet name: Public subnet 1

Private subnet: 10.0.1.0/24 (251 IP addresses available)

Availability Zone: us-east-1a

Private subnet name: Private subnet 1

You can add more subnets after AWS creates the VPC.

Specify the details of your NAT instance.

Instance type: m1.small

Key pair name: No key pair

Note: Instance rates apply. [View Rates.](#)

Add endpoints for S3 to your subnets

Subnet: Public subnet

Policy: ☒ Full Access - Allow access by any user or service within the VPC using credentials from any AWS accounts to any S3 resources ☐ Custom

Enable DNS hostnames: ☒ Yes ☐ No

Hardware tenancy: Default

You should eventually get the success screen

Click OK

Click on "Your VPCs".

Here you see the default VPC and the new VPC.

The screenshot shows the AWS VPC Dashboard with a table of VPCs. The table has columns: Name, VPC ID, State, VPC CIDR, DHCP options set, Route table, Network ACL, Tenancy, and Default VPC. There are two VPCs listed: 'vpc-ae7d40cb' and 'vpc-f8f3ce9d'. The 'vpc-f8f3ce9d' is the newly created VPC.

Name	VPC ID	State	VPC CIDR	DHCP options set	Route table	Network ACL	Tenancy	Default VPC
	vpc-ae7d40cb	available	172.31.0.0/16	dopt-bf8e64da	rtb-b35340d6	acl-54b88b31	Default	Yes
backspace-lab	vpc-f8f3ce9d	available	10.0.0.0/16	dopt-bf8e64da	rtb-66eefd03	acl-391c2e5c	Default	No

Click on the newly created VPC to see its details

The screenshot shows the details page for the VPC 'vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab'. It has two tabs: 'Summary' and 'Tags'. The 'Summary' tab is active, showing the following details:

VPC ID:	vpc-f8f3ce9d backspace-lab	Network ACL:	acl-391c2e5c
State:	available	Tenancy:	Default
VPC CIDR:	10.0.0.0/16	DNS resolution:	yes
DHCP options set:	dopt-bf8e64da	DNS hostnames:	yes
Route table:	rtb-66eefd03		

Here you can see a network ACL and Route Table has been created and associated to the VPC.

The Route Table is the "Main Route Table" and is implicitly associated to a subnet where no explicit association has been created.

Click on subnets to see Private subnet 1 and Public subnet 1.

Click on Private subnet 1 to see its details

subnet-66d89411 (10.0.1.0/24) | Private subnet 1

Summary | Route Table | Network ACL | Tags

Subnet ID: subnet-66d89411 | Private subnet 1
 CIDR: 10.0.1.0/24
 State: available
 VPC: vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab
 Available IPs: 251

Availability Zone: us-east-1a
 Route table: rtb-66eefd03
 Network ACL: acl-391c2e5c
 Default subnet: no
 Auto-assign Public IP: no

Here you can see the Main Route table has been implicitly associated with the subnet.

Click on the Route Table tab.

subnet-66d89411 (10.0.1.0/24) | Private subnet 1

Summary | Route Table | Network ACL | Tags

Edit

Route Table: rtb-66eefd03

Destination	Target
10.0.0.0/16	local
pl-63a5400a (com.amazonaws.us-east-1.s3)	vpce-c20eebab
0.0.0.0/0	eni-c7cdf48f / i-4cfd649c

The following routes have been created by the VPC Wizard

1. Route for local VPC traffic.
2. Destination the S3 service with target the VPC endpoint for the S3 service.
3. Destination all other traffic with target the ENI of the NAT instance.

Click on the Network ACL tab.

subnet-66d89411 (10.0.1.0/24) | Private subnet 1

Summary Route Table **Network ACL** Tags

[Edit](#)

Network ACL: [acl-391c2e5c](#)

Inbound:

Rule #	Type	Protocol	Port Range / ICMP Type	Source	Allow / Deny
100	ALL Traffic	ALL	ALL	0.0.0.0/0	ALLOW
*	ALL Traffic	ALL	ALL	0.0.0.0/0	DENY

Outbound:

Rule #	Type	Protocol	Port Range / ICMP Type	Destination	Allow / Deny
100	ALL Traffic	ALL	ALL	0.0.0.0/0	ALLOW
*	ALL Traffic	ALL	ALL	0.0.0.0/0	DENY

Here an NACL has been defined with an explicit allow for inbound and outbound traffic. We will be tightening this up later when we add our second availability zone by creating public and private subnet ACLs that restrict port access.

Now click on Public Subnet 1 to see its details.

subnet-65d89412 (10.0.0.0/24) | Public subnet 1

Summary **Route Table** Network ACL Tags

Subnet ID: subnet-65d89412 | Public subnet 1

CIDR: 10.0.0.0/24

State: available

VPC: [vpc-f8f3ce9d \(10.0.0.0/16\)](#) | [backspace-lab](#)

Available IPs: 250

Availability Zone: us-east-1a

Route table: [rtb-61eefd04](#)

Network ACL: [acl-391c2e5c](#)

Default subnet: no

Auto-assign Public IP: no

Here you can see that the same NACL has been defined but a different Route Table has been created by the VPC Wizard.

Click on the Route Table tab.

subnet-65d89412 (10.0.0.0/24) | Public subnet 1

Summary **Route Table** Network ACL Tags

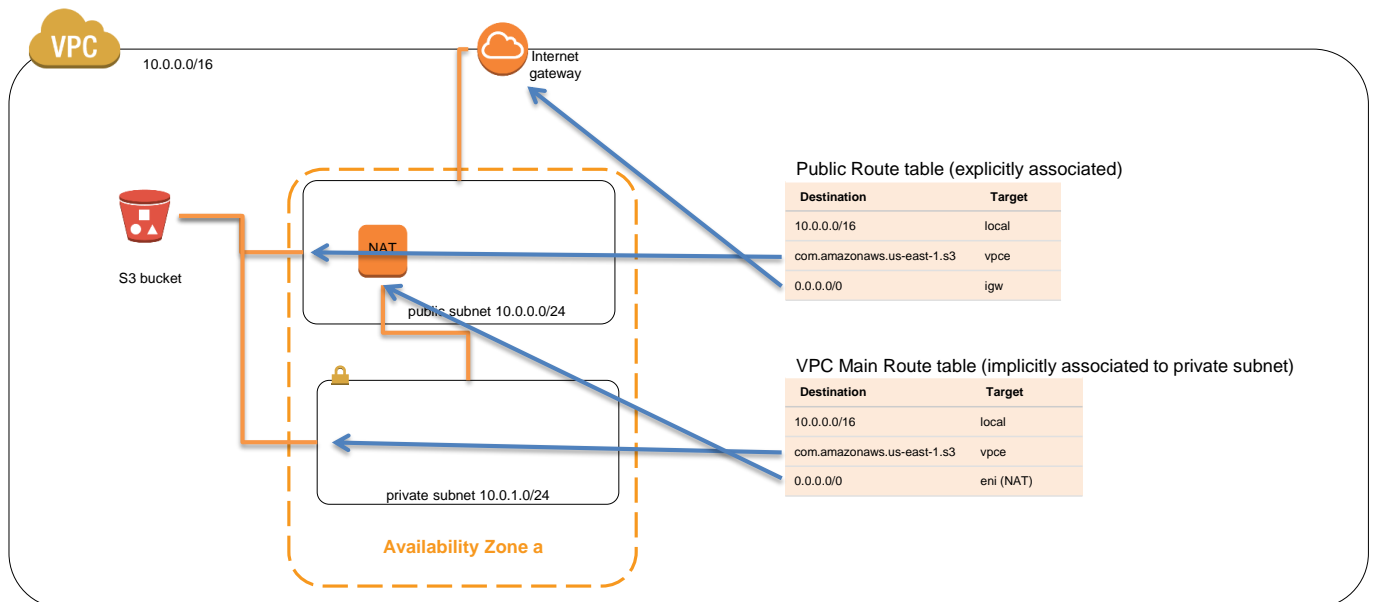

[Edit](#)

Route Table: [rtb-61eefd04](#)

Destination	Target
10.0.0.0/16	local
pl-63a5400a (com.amazonaws.us-east-1.s3)	vpce-c20eebab
0.0.0.0/0	igw-e8d3a78d

The following routes have been created by the VPC Wizard

1. Route for local VPC traffic.
2. Destination the S3 service with target the VPC endpoint for the S3 service.
3. Destination all other traffic with target the VPC Internet Gateway.

Now go to the EC2 Console and select instances to see the NAT instance.

Instance: **i-4cfd649c** Elastic IP: 54.152.96.9

[Description](#)
[Status Checks](#)
[Monitoring](#)
[Tags](#)

Instance ID	i-4cfd649c	Public DNS	ec2-54-152-96-9.compute-1.amazonaws.com

Private IPs	10.0.0.191	Security groups	default. view rules
Secondary private IPs		Scheduled events	No scheduled events
VPC ID	vpc-f8f3ce9d	AMI ID	amzn-ami-vpc-nat-pv-2014.09.1.x86_64-eks (ami-224dc94a)
Subnet ID	subnet-65d89412	Platform	-
Network interfaces	eth0	IAM role	-
Source/dest. check	False	Key pair name	-
EBS-optimized	False	Owner	802694931986
Root device type	ebs	Launch time	May 27, 2015 at 12:18:01 AM UTC+10 (less than one hour)
Root device	/dev/sda1	Termination protection	False
Block devices	/dev/sda1	Lifecycle	normal
		Monitoring	basic
		Alarm status	None
		Kernel ID	aki-919dca8
		RAM disk ID	-
		Placement group	-
		Virtualization	paravirtual

There are a couple of things to be aware of with this NAT instance created by the VPC wizard:

The virtualization type is paravirtual (PV). It is recommended by AWS for long term support to use hardware virtual machine (HVM) instances. More information on Virtualization Types can be found in the EC2 User Guide for Linux.

The default security group has been used. The following security group rules are recommended for NAT instances.

NATSG: Recommended Rules

Inbound			
Source	Protocol	Port Range	Comments
The security group ID (sg-xxxxxxx)	All	All	Allow inbound traffic from instances assigned to the same security group.
10.0.1.0/24	TCP	80	Allow inbound HTTP traffic from database servers in the private subnet
10.0.1.0/24	TCP	443	Allow inbound HTTPS traffic from database servers in the private subnet
Your network's public IP address range	TCP	22	Allow inbound SSH access to the NAT instance from your network (over the Internet gateway)
Outbound			
Destination	Protocol	Port Range	Comments
0.0.0.0/0	TCP	80	Allow outbound HTTP access to the Internet (over the Internet gateway)
0.0.0.0/0	TCP	443	Allow outbound HTTPS access to the Internet (over the Internet gateway)

Click on Security Groups

Click "Create Security Group"

Name it NATSG.

Select our newly created VPC.

Add the inbound rules as detailed in the above table. Select "My IP" for port 22.

Create Security Group

Security group name: NATSG

Description: NAT Instance Security Group

VPC: vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab
* denotes default VPC

Security group rules:

Inbound Outbound

Type	Protocol	Port Range	Source
HTTP	TCP	80	Custom IP 10.0.1.0/24
HTTPS	TCP	443	Custom IP 10.0.1.0/24
SSH	TCP	22	My IP

Add Rule

Cancel Create

Add the outbound rules as detailed in the above table.

Create Security Group

Security group name: NATSG

Description: NAT Instance Security Group

VPC: vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab
* denotes default VPC

Security group rules:

Inbound Outbound

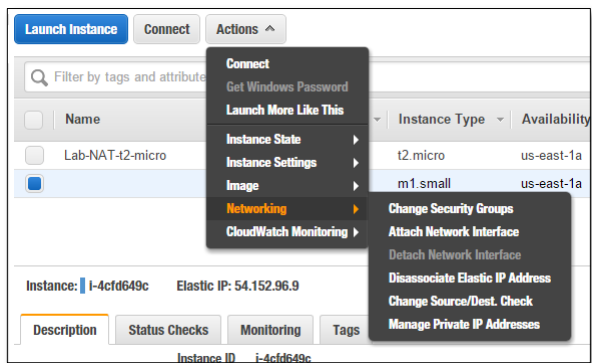

Type	Protocol	Port Range	Destination
HTTP	TCP	80	Anywhere 0.0.0.0/0
HTTPS	TCP	443	Anywhere 0.0.0.0/0

Add Rule

Cancel Create

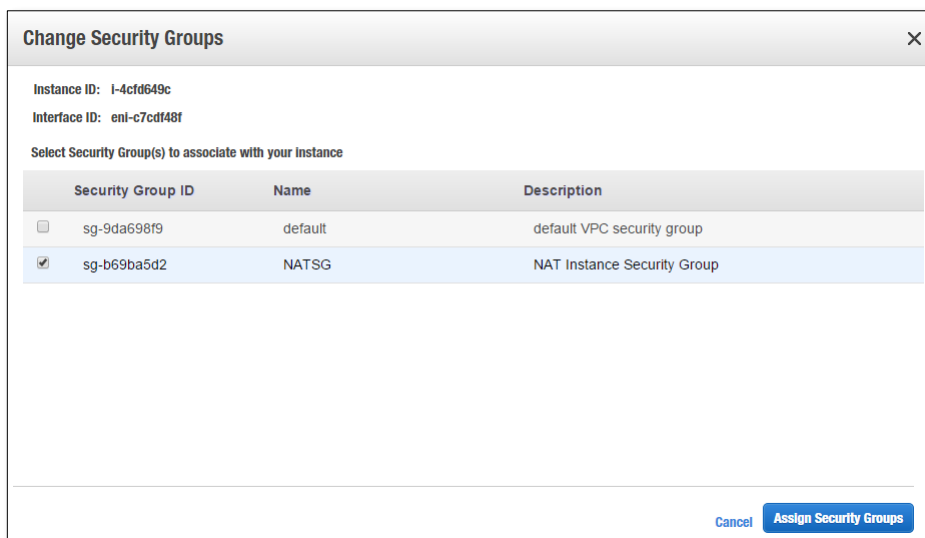

After the security group is created go back to our instance description page.

Click on Change Security Groups

Deselect the default security group.

Select the NATSG security group.

Click Assign Security Groups.

Here you can also see that an Elastic IP has been associated to the m1.small instance.

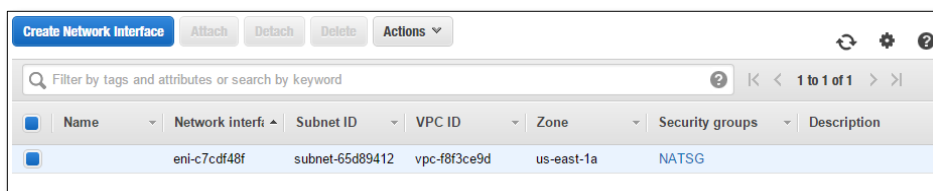

i-4cfd649c	m1.small	us-east-1a	running	2/2 checks...	None	ec2-54-152-96-9.compu...	54.152.96.9
------------	----------	------------	---------	---------------	------	--------------------------	-------------

▶ Moving Elastic Network Interfaces to another Instance

In this section we will look at instance virtualisation types and how to change an Elastic Network Interface connection from one instance to another. This allows us to replace the NAT instance created by the VPC Wizard to a custom NAT instance we create.

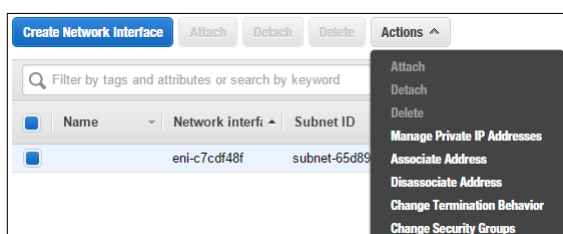

Click on “Network Interfaces”.

Here you can see the VPC Wizard has associated the NAT Elastic IP with an ENI.

	Name	Network interface	Subnet ID	VPC ID	Zone	Security groups	Description
<input checked="" type="checkbox"/>	eni-c7cdf48f		subnet-65d89412	vpc-f8f3ce9d	us-east-1a	NATSG	

We want to ensure this ENI is not accidentally deleted so we will change the termination behaviour by unchecking “Delete on termination”.

	Name	Network interface	Subnet ID
<input checked="" type="checkbox"/>	eni-c7cdf48f		subnet-65d89412

- Attach
- Detach
- Delete
- Manage Private IP Addresses
- Associate Address
- Disassociate Address
- Change Termination Behavior
- Change Security Groups

Name the ENI “NAT-ENI” so you can find it easily.

	Name	Network interface	Subnet ID	VPC ID	Zone	Security groups	Description	Instance ID	Status	Public IP
<input checked="" type="checkbox"/>	NAT ENI	eni-c7cdf48f	subnet-65d89412	vpc-f8f3ce9d	us-east-1a	NATSG		i-4cfd649c	● in-use	54.152.96.9

Go back to instances

Now terminate the NAT instance.

After the instance has terminated, go back to Network Interfaces

Create Network Interface

Attach

Detach

Delete

Actions

Filter by tags and attributes or search by keyword

<input type="checkbox"/>	Name	Network interface	Subnet ID	VPC ID	Zone	Security groups	Description	Instance ID	Status	Public IP
<input checked="" type="checkbox"/>	NAT ENI	eni-c7cdf48f	subnet-65d89412	vpc-f8f3ce9d	us-east-1a	NATSG			<div><div></div>available</div>	54.152.96.9

Here you can see the ENI is now available to be attached to another instance.

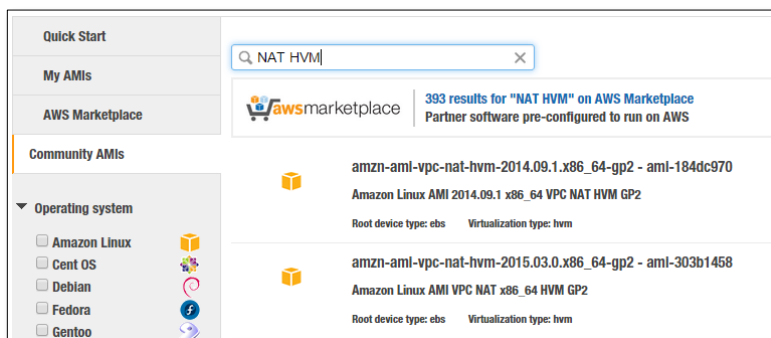

For this example we will remove this NAT instance and replace it with a smaller t2.micro instance. Notice the virtualisation type of the current NAT instance is paravirtual which does not support the new instance types like T2. For long term support it better to use HVM type AMIs. We will create a new NAT from a “HVM” type AMI.

We will then detach the ENI from the m1 instance and attach it to the new T2 instance.

Go back to instances

Select “Launch Instance”

Search Community AMIs for “NAT HVM”

Select a suitable AMI and then select the t2.micro instance type.

Click “Next: Configure Instance Details”

Select the new VPC

Select “Public Subnet 1”

Click “Protect against accidental termination”

Click on Network Interfaces

Select the “NAT ENI”

Step 3: Configure Instance Details

Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of the lower pricing, assign an access management

Number of instances	1
Purchasing option	<input type="checkbox"/> Request Spot Instances
Network	vpc-f8f3ce9d (10.0.0.0/16) backspace-lab Create new VPC
Subnet	subnet-65d89412(10.0.0.0/24) Public subnet 1 u Create new subnet 250 IP Addresses available
Auto-assign Public IP	Disable
IAM role	None Create new IAM role
Shutdown behavior	Stop
Enable termination protection	<input checked="" type="checkbox"/> Protect against accidental termination
Monitoring	<input type="checkbox"/> Enable CloudWatch detailed monitoring Additional charges apply.
Tenancy	Shared tenancy (multi-tenant hardware) Additional charges will apply for dedicated tenancy.

Network interfaces

Device	Network Interface	Subnet	Primary IP	Secondary IP addresses
eth0	eni-c7cdf48f (NAT ENI)	subnet-65d8941		

Click “Next: Add Storage”

Click “Next: Tag Instance”

Name it “Lab-NAT-t2-micro”

Click “Next: Configure Security Group”

Select the NATSG security group.

Step 6: Configure Security Group

A security group is a set of firewall rules that control the traffic for your instance. On this page, you can add rules to allow specific traffic to reach your instance. For example, if you want to set up a web server and allow Internet traffic to reach your instance, add rules that allow unrestricted access to the HTTP and HTTPS ports. You can create a new security group or select from an existing one below. [Learn more](#) about Amazon EC2 security groups.

Assign a security group: ☐ Create a new security group

☒ Select an existing security group

Security Group ID	Name	Description	Actions
<input type="checkbox"/> sg-9da698f9	default	default VPC security group	Copy to new
<input checked="" type="checkbox"/> sg-b69ba5d2	NATSG	NAT Instance Security Group	Copy to new

Inbound rules for sg-b69ba5d2 (Selected security groups: sg-b69ba5d2)

Type	Protocol	Port Range	Source
SSH	TCP	22	203.206.165.58/32
HTTP	TCP	80	10.0.1.0/24
HTTPS	TCP	443	10.0.1.0/24

Click “Review and Launch”

Click “Launch”

Select an existing key pair or create a new key pair

A key pair consists of a public key that AWS stores, and a private key file that you store. Together, they allow you to connect to your instance securely. For Windows AMIs, the private key file is required to obtain the password used to log into your instance. For Linux AMIs, the private key file allows you to securely SSH into your instance.

Note: The selected key pair will be added to the set of keys authorized for this instance. [Learn more about removing existing key pairs from a public AMI.](#)

Create a new key pair

Key pair name
backspace-lab

Download Key Pair

You have to download the private key file (*.pem file) before you can continue. Store it in a secure and accessible location. You will not be able to download the file again after it's created.

Cancel Launch Instances

Select an existing key pair or create a new one.

Make sure you have downloaded the key pair before proceeding.

Click “Launch Instances”

Go back to “Instances”

You will now see that the Elastic IP is now associated with the new t2.micro instance.

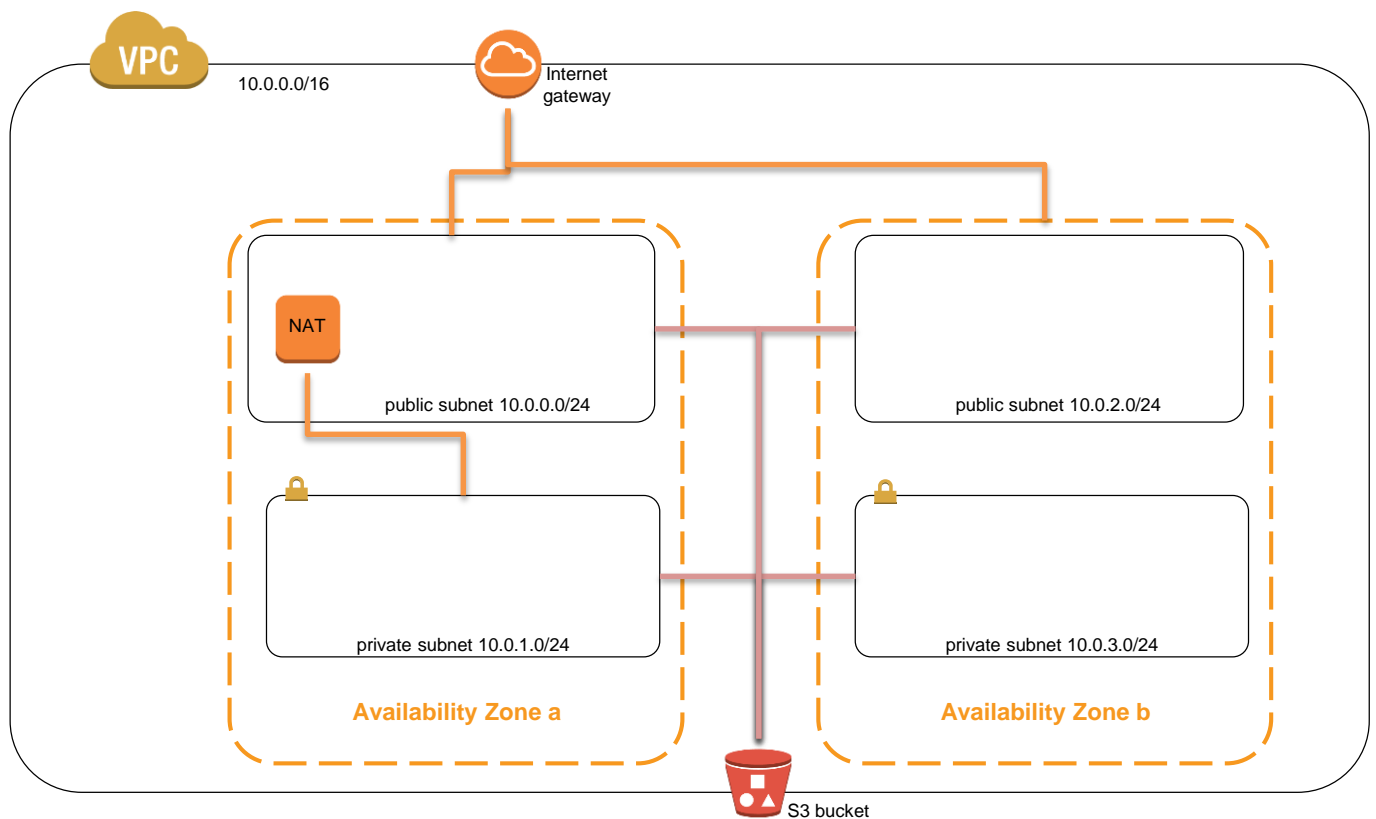

<input checked="" type="checkbox"/>	Lab-NAT-t2-micro	i-757de4a5	t2.micro	us-east-1a	running	Initializing	None	ec2-54-152-96-9.compu...	54.152.96.9
-------------------------------------	------------------	------------	----------	------------	----------------------	--------------	------	--------------------------	-----------------------------

Now check that “source destination check” on the new instance is disabled. Without this disabled, NAT communication cannot be established.

▶ Creating Public and Private Subnets in a Second AZ

In this section we will look increase the availability of our VPC architecture by creating subnets in a second availability zone.

Go to "Subnets"

Click "Create Subnet"

Call it "Private subnet 2"

Select the newly created VPC

Select us-east-1b

Use CIDR block 10.0.3.0/24

Create Subnet [X]

Use the CIDR format to specify your subnet's IP address block (e.g., 10.0.0.0/24). Note that block sizes must be between a /16 netmask and /28 netmask. Also, note that a subnet can be the same size as your VPC.

Name tag: Private subnet 2 ⓘ

VPC: vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab ⓘ

Availability Zone: us-east-1b ⓘ

CIDR block: 10.0.3.0/24 ⓘ

Cancel Yes, Create

Click "Create Subnet" again

Call it "Public subnet 2"

Select the newly created VPC

Select us-east-1b

Use CIDR block 10.0.2.0/24

Create Subnet [X]

Use the CIDR format to specify your subnet's IP address block (e.g., 10.0.0.0/24). Note that block sizes must be between a /16 netmask and /28 netmask. Also, note that a subnet can be the same size as your VPC.

Name tag: Public subnet 2 ⓘ

VPC: vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab ⓘ

Availability Zone: us-east-1b ⓘ

CIDR block: 10.0.2.0/24 ⓘ

Cancel Yes, Create

Click on Public subnet 2 and click the Route Table tab.

subnet-1380e04a (10.0.2.0/24) | Public subnet 2

Summary Route Table Network ACL Tags

Edit

Route Table: **rtb-66eefd03**

Destination	Target
10.0.0.0/16	local
pl-63a5400a (com.amazonaws.us-east-1.s3)	vpce-c20eebab
0.0.0.0/0	eni-c7cd48f / i-07a23bd7

A private subnet has been created because we have not explicitly defined a route to the Internet Gateway.

We will now change from the Main Route table to the Public Route table defined previously.

Click on edit and select the Public Route table defined in Public subnet 1. When you select it the target will change to show the IGW.

Click Save

subnet-1380e04a (10.0.2.0/24) | Public subnet 2

Summary Route Table Network ACL Tags

Cancel Save

Current Route Table: **rtb-66eefd03**

Change to: **rtb-61eefd04**

Destination	Target
10.0.0.0/16	local
pl-63a5400a (com.amazonaws.us-east-1.s3)	vpce-c20eebab
0.0.0.0/0	igw-e8d3a78d

We will now tighten up our NACL by creating public and private subnet ACLs and only defining the ports required to be open:

- HTTP (port 80)
- HTTPS (port 443)
- SSH (port 22)
- MySQL (port 3306)
- Linux kernels use ephemeral (short lived) ports 32768-61000.
- Requests originating from ELBs use ephemeral ports 1024-65535.

ACL Rules for the Private Subnet

Inbound					
Rule #	Source IP	Protocol	Port	Allow/Deny	Comments
100	10.0.0.0/24	TCP	3306	ALLOW	Allows web servers in public subnet 1 to read and write to MySQL servers in the private subnet
110	10.0.2.0/24	TCP	3306	ALLOW	Allows web servers in public subnet 2 to read and write to MySQL servers in the private subnet
120	10.0.0.0/24	TCP	22	ALLOW	Allows inbound SSH traffic from the SSH bastion in public subnet 1
130	10.0.2.0/24	TCP	22	ALLOW	Allows inbound SSH traffic from the SSH bastion in public subnet 2
140	0.0.0.0/0	TCP	32768-61000	ALLOW	Allows inbound return traffic from NAT instance in the public subnet for requests originating in the private subnet
*	0.0.0.0/0	all	all	DENY	Denies all inbound traffic not already handled by a preceding rule (not modifiable)
Outbound					
Rule #	Dest IP	Protocol	Port	Allow/Deny	Comments
100	0.0.0.0/0	TCP	80	ALLOW	Allows outbound HTTP traffic from the subnet to the Internet
110	0.0.0.0/0	TCP	443	ALLOW	Allows outbound HTTPS traffic from the subnet to the Internet
120	10.0.0.0/24	TCP	32768-61000	ALLOW	Allows outbound responses to public subnet 1 (for example, responses to web servers in the public subnet that are communicating with DB Servers in the private subnet)
130	10.0.2.0/24	TCP	32768-61000	ALLOW	Allows outbound responses to public subnet 2 (for example, responses to web servers in the public subnet that are communicating with DB Servers in the private subnet)
*	0.0.0.0/0	all	all	DENY	Denies all outbound traffic not already handled by a preceding rule (not modifiable)

ACL Rules for the Public Subnet

Inbound					
Rule #	Source IP	Protocol	Port	Allow/Deny	Comments
100	0.0.0.0/0	TCP	80	ALLOW	Allows inbound HTTP traffic from anywhere
110	0.0.0.0/0	TCP	443	ALLOW	Allows inbound HTTPS traffic from anywhere
120	Public IP address range of your home network	TCP	22	ALLOW	Allows inbound SSH traffic from your home network (over the Internet gateway)
130	0.0.0.0/0	TCP	1024-65535	ALLOW	Allows inbound return traffic from requests originating in the subnet and from the ELB
*	0.0.0.0/0	all	all	DENY	Denies all inbound traffic not already handled by a preceding rule (not modifiable)
Outbound					
Rule #	Dest IP	Protocol	Port	Allow/Deny	Comments
100	0.0.0.0/0	TCP	80	ALLOW	Allows outbound HTTP traffic from the subnet to the Internet
110	0.0.0.0/0	TCP	443	ALLOW	Allows outbound HTTPS traffic from the subnet to the Internet
120	10.0.1.0/24	TCP	3306	ALLOW	Allows outbound MySQL access to database servers in private subnet 1
130	10.0.3.0/24	TCP	3306	ALLOW	Allows outbound MySQL access to database servers in private subnet 2
140	0.0.0.0/0	TCP	1024-65535	ALLOW	Allows outbound responses to the Internet or the ELB
150	10.0.1.0/24	TCP	22	ALLOW	Allows outbound SSH access to instances in your private subnet 1 (from the SSH bastion)
160	10.0.3.0/24	TCP	22	ALLOW	Allows outbound SSH access to instances in your private subnet 2 (from the SSH bastion)
*	0.0.0.0/0	all	all	DENY	Denies all outbound traffic not already handled by a preceding rule (not modifiable)

We will create two new NACLs called Public subnet ACL and Private subnet ACL. Unlike security groups, NACLs are stateless and require response traffic to be allowed on both inbound and outbound rules.

Go to the Network ACLs page and click “Create Network ACL”

Call it “Public NACL”

Create Network ACL

A network ACL is an optional layer of security that acts as a firewall for controlling traffic in and out of a subnet.

Name tag

▶ Creating an ELB and Auto Scaling Group

In this section we will look at increasing the availability and fault tolerance of our VPC architecture by creating an Auto Scaling Group and balancing traffic across instances using an Elastic Load Balancer.

Go back to the EC2 console and select Security Groups

The security group settings recommended for a web server are:

WebServerSG: Recommended Rules

Inbound			
Source	Protocol	Port Range	Comments
The security group ID (sg-xxxxxxx)	All	All	Allow inbound traffic from instances assigned to the same security group.
0.0.0.0/0	TCP	80	Allow inbound HTTP access to the web servers from anywhere
0.0.0.0/0	TCP	443	Allow inbound HTTPS access to the web servers from anywhere
Your home network's public IP address range	TCP	22	Allow inbound SSH access to Linux instances from your home network (over the Internet gateway)
Outbound			
Destination	Protocol	Port Range	Comments
The ID of your DBServerSG security group	TCP	3306	Allow outbound MySQL access to the database servers assigned to DBServerSG

Click Security Groups

Click "Create Security Group"

Name the security group WebServerSG.

Add the inbound rules as detailed in the above table. Select "My IP" for port 22. We will add the outbound rules after the DB Security Group is created.

Create Security Group

Security group name: WebServerSG

Description: Web Server Security Group

VPC: vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab
* denotes default VPC

Security group rules:

Inbound | Outbound

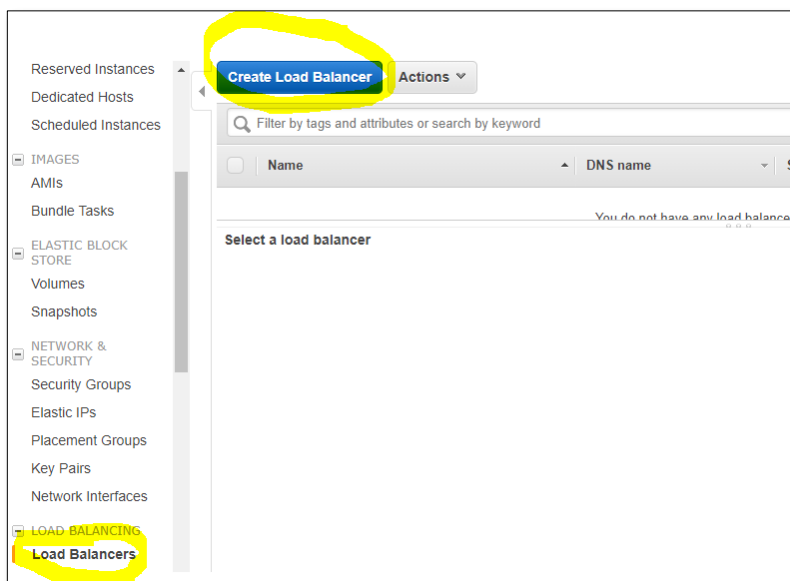

Type	Protocol	Port Range	Source
HTTP	TCP	80	Anywhere
HTTPS	TCP	443	Anywhere
SSH	TCP	22	My IP

Add Rule

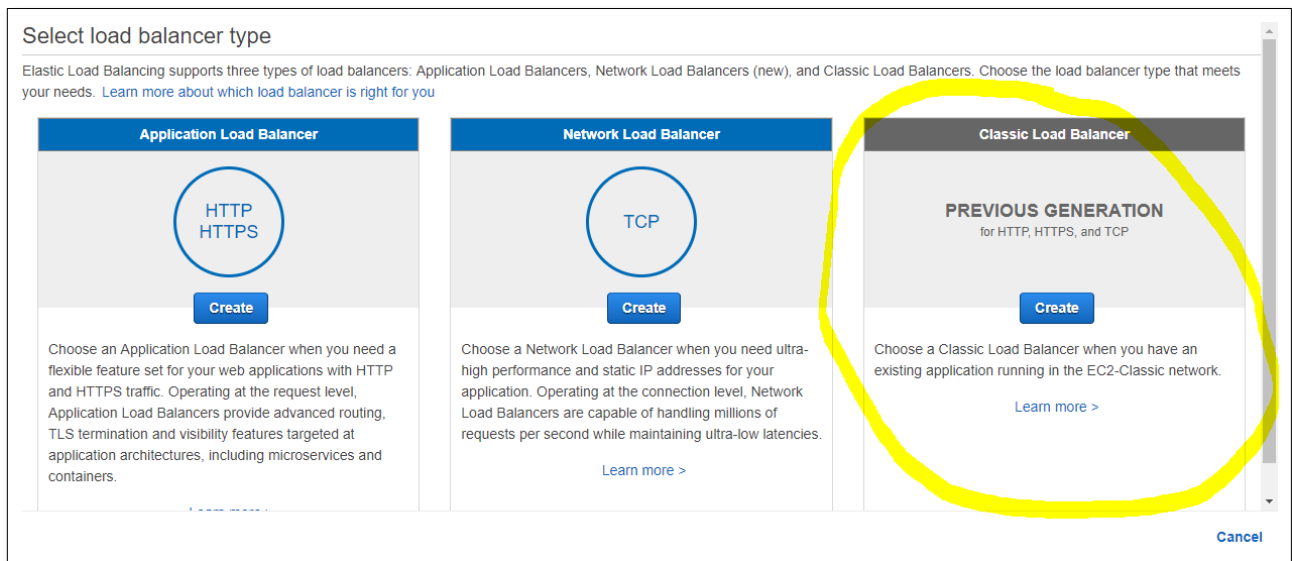

Cancel Create

Select Load Balancers

Click "Create Load balancer"

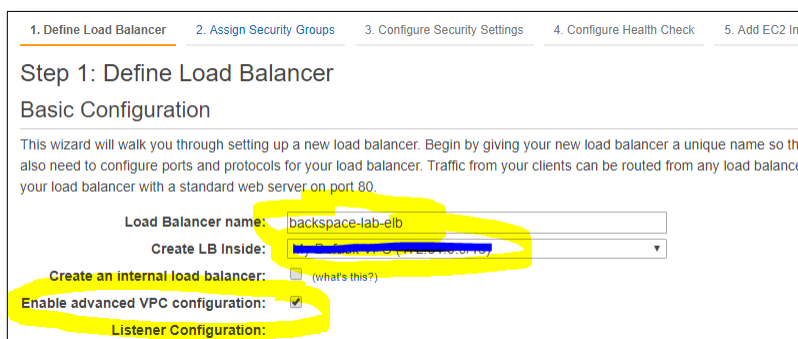

Select "Classic Load Balancer"

Name it "backspace-lab-elb"

Select the newly created VPC (not the default VPC)

Check "Enable advanced VPC configuration"

In a production environment we would add an https listener. As this would require us to purchase and upload an SSL certificate we will not add it for this lab.

Select the two public subnets.

Step 1: Define Load Balancer

Basic Configuration

This wizard will walk you through setting up a new load balancer. Begin by giving your new load balancer a unique name so that you can identify it from other load balancers you might create. You will also need to configure ports and protocols for your load balancer. Traffic from your clients can be routed from any load balancer port to any port on your EC2 instances. By default, we've configured your load balancer with a standard web server on port 80.

Load Balancer name:

Create LB inside: ▼

Create an internal load balancer: ☐ (what's this?)

Enable advanced VPC configuration: ☒

Listener Configuration:

Load Balancer Protocol	Load Balancer Port	Instance Protocol	Instance Port
HTTP ▼	80	HTTP ▼	80

Add

Select Subnets

You will need to select a Subnet for each Availability Zone where you wish traffic to be routed by your load balancer. If you have instances in only one Availability Zone, please select at least two Subnets in different Availability Zones to provide higher availability for your load balancer.

VPC vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab

Available Subnets

Actions	Availability Zone	Subnet ID	Subnet CIDR	Name
+	us-east-1a	subnet-66d89411	10.0.1.0/24	Private subnet 1
+	us-east-1b	subnet-6880e031	10.0.3.0/24	Private subnet 2

Selected Subnets

Actions	Availability Zone	Subnet ID	Subnet CIDR	Name
−	us-east-1a	subnet-65d89412	10.0.0.0/24	Public subnet 1
−	us-east-1b	subnet-1380e04a	10.0.2.0/24	Public subnet 2

Cancel

Next: Assign Security Groups

Click "Next: Assign Security Groups"

Select the WebServerSG security group.

Step 2: Assign Security Groups

You have selected the option of having your Elastic Load Balancer inside of a VPC, which allows you to assign security groups to your load balancer. Please select the security groups to assign to this load balancer. This can be changed at any time.

Assign a security group: ☐ Create a new security group
☒ Select an existing security group

Filter VPC security groups ▼

Security Group ID	Name	Description	Actions
<input type="checkbox"/> sg-9da698f9	default	default VPC security group	Copy to new
<input type="checkbox"/> sg-b69ba5d2	NATSG	NAT Instance Security Group	Copy to new
<input checked="" type="checkbox"/> sg-cc82bca8	WebServerSG	Web Server Security Group	Copy to new

Click "Next: Configure Security Settings"

A warning will come up informing us that we have not added an https listener. Ignore this for the lab.

Click “Next: Configure Health Check”

Change to Ping Protocol TCP and Ping Port 80.

Your load balancer will automatically perform health checks on your EC2 instances and only route traffic to instances that pass the health check. If an instance fails the health check, it is automatically removed from the load balancer. Customize the health check to meet your specific needs.

Ping Protocol
Ping Port

Click “Next: Add EC2 Instances”

Click “Next: Add Tags”

Add the tag Name Webserver for the EC2 instances.

Step 6: Add Tags

Apply tags to your resources to help organize and identify them.

A tag consists of a case-sensitive key-value pair. For example, you could define a tag with key = Name and value = Webserver. [Learn more](#) about tagging your Amazon EC2 resources.

Key	Value
<input type="text" value="Name"/>	<input type="text" value="Webserver"/>

Create Tag

Click “Review and Create”

Step 7: Review

Please review the load balancer details before continuing

Load Balancer Creation Status

Successfully created load balancer
 Load balancer **backspace-lab-elb** was successfully created.
 Note: It may take a few minutes for your instances to become active in the new load balancer.

Looking at the newly created load balancer we note that stickiness on Port Configuration is disabled.

It is important to maintain session state when using Auto Scaling otherwise when traffic is diverted to another instance the temporary application data is lost. Session state can be maintained two ways:

1. Storing session state in persistent storage such as AWS ElastiCache or DynamoDB.
2. Using stickiness on the port configuration.

Using stickiness is the simplest solution although it does have disadvantages. If you have one instance fully loaded and another instance kicks in, the second instance will have little traffic. This means the instances aren't well balanced. This will change over time as users drop off and new users come online.

If you effectively scale horizontally, this will reduce the balancing disadvantage of stickiness. You should use many small instances rather than large instances. For example if you have the minimum number of instances set to 4, when another instance kicks in, the effect is not as significant.

Load balancer: backspace-lab-elb

Description Instances Health Check Monitoring Security Listeners Tags

DNS Name: backspace-lab-elb-637553000.us-east-1.elb.amazonaws.com (A Record)

Note: Because the set of IP addresses associated with a LoadBalancer can change over time, you should never create an "A" record with any specific IP address. If you want to use a friendly DNS name for your load balancer instead of the name generated by the Elastic Load Balancing service, you should create a CNAME record for the LoadBalancer DNS name, or use Amazon Route 53 to create a hosted zone. For more information, see [Using Domain Names With Elastic Load Balancing](#).

Update from AWS:

On 8 July 2015 AWS announced the introduction of scaling policies with steps:

Today we are making Auto Scaling even more flexible with the addition of new scaling policies with steps.

Our goal is to allow you to create systems that can do an even better job of responding to rapid and dramatic changes in load. You can now define a scaling policy that will respond to the *magnitude* of the alarm breach in a proportionate and appropriate way. For example, if you try to keep your average CPU utilization below 50% you can have a standard response for a modest breach (50% to 60%), two more for somewhat bigger breaches (60% to 70% and 70% to 80%), and a super-aggressive one for utilization that exceeds 80%.

Here's how I set this up for my Auto Scaling group:

The screenshot shows the 'Increase Group Size' scaling policy configuration in the AWS Auto Scaling console. The policy is named 'Increase Group Size' and is triggered by the 'SystemBusy' alarm. The alarm condition is 'breaches the alarm threshold: CPUUtilization >= 50 for 60 seconds for the metric dimensions'. The policy has four steps, each adding a fixed number of instances based on CPU utilization thresholds:

Action	Instances	When	Condition
Add	1	instances	when 50 <= CPUUtilization < 60
Add	2	instances	when 60 <= CPUUtilization < 70
Add	4	instances	when 70 <= CPUUtilization < 80
Add	8	instances	when 80 <= CPUUtilization < +infinity

Below the steps, there is an 'Add step' button and an information icon. The 'Instances need' section is set to '300 seconds to warm up after each step'. At the bottom, there is a link to 'Create a simple scaling policy'.

In this example I added a fixed number (1, 2, 4, or 8) of instances to the group. I could have chosen to define the policies on a percentage basis, increasing the instance count by (say) 50%, 100%, 150%, and 200% at the respective steps. The empty upper bound in the final step is effectively positive infinity. You can also define a similar set of increasingly aggressive policies for scaling down.

As you can see from the example above, you can also tell Auto Scaling how long it should take for an instance to warm up and be ready to start sharing the load. While this waiting period is in effect, Auto Scaling will include the newly launched instances when it computes the current size of the group. However, during this scaling time, the instances are not factored in to the CloudWatch metrics for the group. This avoids unnecessary scaling while the new instances prepare themselves to take on their share of the load.

Step policies continuously evaluate the alarms during a scaling activity and while unhealthy instances are being replaced with new ones. This allows for faster response to changes in demand. Let's say the CPU load increases and the first step in the policy is activated. During the specified warm up period (300 seconds in this example), the load might continue to increase and a more aggressive response might be appropriate. Fortunately, Auto Scaling is in violent agreement with this sentiment and will switch in to high gear (and use one of the higher steps) automatically. If you create multiple step scaling policies for the same resource (perhaps based on CPU utilization and inbound network traffic) and both of them fire at approximately the same time, Auto Scaling will look at both policies and choose the one that results in the change of the highest magnitude.

You can also create these new scaling policies using the [AWS Command Line Interface \(CLI\)](#) or the [Auto Scaling API](#).

Select "Use scaling policies to adjust the capacity of this group"

Add alarm to "Increase Group Size"

Disable SNS notification.

Alarm at \geq 75% CPU utilisation for 2 x 5 minute periods

Create Alarm

You can use CloudWatch alarms to be notified automatically whenever metric data reaches a level you define.
To edit an alarm, first choose whom to notify and then define when the notification should be sent.

☐ Send a notification to: No SNS topics found...

Whenever: Average of CPU Utilization

Is: >= 75 Percent

For at least: 2 consecutive period(s) of 5 Minutes

Name of alarm: awssec2-backspace-lab-wordpress-as-CPU-Utilization

CPU Utilization Percent

Graph showing CPU Utilization Percent over time for the resource backspace-lab-wordpress-as. The Y-axis ranges from 0 to 60. The X-axis shows dates and times: 5/26 08:00, 5/26 10:00, and 5/26 12:00.

Cancel Create Alarm

Click Create Alarm

Add alarm to "Decrease Group Size"

Disable SNS notification.

Alarm at < 50% CPU utilisation for 4 x 5 minute periods

Change the name of the alarm from high to low (otherwise you will change the high alarm).

Edit Alarm

You can use CloudWatch alarms to be notified automatically whenever metric data reaches a level you define. To edit an alarm, first choose whom to notify and then define when the notification should be sent.

☐ Send a notification to: No SNS topics found...

Create Auto Scaling Group

You can optionally add scaling policies if you want to adjust the size (number of instances) of your group automatically. A scaling policy is a percentage of the existing group size, or you can set the group to an exact size. When the alarm triggers, it will execute the policy and add or remove instances.

☐ Keep this group at its initial size

☒ Use scaling policies to adjust the capacity of this group

Scale between **2** and **10** instances. These will be the minimum and maximum size of your group.

Increase Group Size

Name: **Increase Group Size**

Execute policy when: **awsec2-backspace-lab-web-as-CPU-Utilization** [Edit](#) [Remove](#)
breaches the alarm threshold: **CPUUtilization >= 75 for 2 consecutive periods of 300 seconds**
for the metric dimensions **AutoScalingGroupName = backspace-lab-web-as**

Take the action: **Add** **1** **instances**

And then wait: **300** seconds before allowing another scaling activity

Decrease Group Size

Name: **Decrease Group Size**

Execute policy when: **awsec2-backspace-lab-web-as-Low-CPU-Utilization** [Edit](#) [Remove](#)
breaches the alarm threshold: **CPUUtilization < 50 for 4 consecutive periods of 300 seconds**
for the metric dimensions **AutoScalingGroupName = backspace-lab-web-as**

Take the action: **Remove** **1** **instances**

And then wait: **300** seconds before allowing another scaling activity

If you click on the “Scaling History” tab you can see the instances being created in the two availability zones.

The screenshot shows the 'Create Auto Scaling group' button and an 'Actions' dropdown. Below is a table of Auto Scaling groups. The 'backspace-lab...' group is selected. The 'Scaling History' tab is active, showing a table of scaling events.

Name	Launch Configuration	Instances	Desired	Min	Max	Availability Zones
backspace-lab...	backspace-lab-wordpre...	0 ⓘ	2	2	10	us-east-1b, us-east-1a

Auto Scaling Group: backspace-lab-web-as

Details | **Scaling History** | Scaling Policies | Instances | Notifications | Tags

Filter: Any Status | Filter scaling history...

Status	Description
In progress	Launching a new EC2 instance: i-ca71ff35
In progress	Launching a new EC2 instance: i-c630a916

If you click on the “Instances” tab you can see the instances are healthy.

The screenshot shows the 'Instances' tab for the 'backspace-lab-web-as' Auto Scaling Group. It displays a table of instances with their IDs, lifecycle states, launch configurations, availability zones, and health status.

Auto Scaling Group: backspace-lab-web-as

Details | Scaling History | **Instances** | Notifications | Tags

Actions

Filter: Any Health Status | Any Lifecycle State | Filter instances...

1 to 2 of 2 Instances

Instance ID	Lifecycle	Launch Configuration Name	Availability Zone	Health Status
i-5ed950a1	InService	backspace-lab-wordpress-launch	us-east-1b	Healthy
i-e7e67e37	InService	backspace-lab-wordpress-launch	us-east-1a	Healthy

If you go to the Load Balancer and select the load balancer you will find the DNS name.

Load balancer: **backspace-lab-elb**

Description Instances Health Check Monitoring Security Listeners Tags

DNS Name: backspace-lab-elb-1143552623.us-east-1.elb.amazonaws.com (A Record)

Note: Because the set of IP addresses associated with a LoadBalancer can change over time, you should never create an "A" record with any specific IP address. If you want to use a friendly DNS name for your load balancer instead of the name generated by the Elastic Load Balancing service, you should create a CNAME record for the LoadBalancer DNS name, or use Amazon Route 53 to create a hosted zone. For more information, see [Using Domain Names With Elastic Load Balancing](#).

Scheme: Internet-facing

Status: **2 of 2 instances in service**

Port Configuration: 80 (HTTP) forwarding to 80 (HTTP)
Stickiness: LBCookieStickinessPolicy, expirationPeriod='3600' (Edit)

Availability Zones: subnet-1380e04a - us-east-1b,
subnet-65d89412 - us-east-1a

Cross-Zone Load Balancing: Enabled (Edit)

Source Security Group: 802694931986/WebServerSG
Owner Alias: 802694931986
Group Name: WebServerSG

Hosted Zone ID: Z3DZXEQ79N41H

VPC ID: vpc-f8f3ce9d

Access Logs: Disabled (Edit)

Connection Settings: Idle Timeout: 60 seconds (Edit)

If you point your browser to the ELB DNS name you will see the WordPress application.

HELLO WORLD!

SEPTEMBER 30, 2014 1 COMMENT

Welcome to WordPress. This is your first post. Edit or delete it, then start blogging!

*If you find that instances are failing health checks and being shut down by your ELB regularly then check your public NACL settings are correct for the ELB allowing TCP traffic on ports 1024-65535. If you still have problems extend your ELB health check timeout and time between checks settings.

So now let's check if our auto scaling group is working.

Terminate the 2 Webserver instances

Launch Instance Connect Actions									
Filter by tags and attributes or search by keyword									
<input type="checkbox"/>	Name	Instance ID	Instance Type	Availability Zone	Instance State	Status Checks	Alarm Status	Public DNS	Public IP
<input type="checkbox"/>	Lab-NAT-t2-micro	i-757de4a5	t2.micro	us-east-1a	running	2/2 checks...	None	ec2-54-152-96-9.compu...	54.152.96.9
<input checked="" type="checkbox"/>	WebServer	i-5ed950a1	t2.micro	us-east-1b	terminated		None		
<input checked="" type="checkbox"/>	WebServer	i-e7e67e37	t2.micro	us-east-1a	terminated		None		

Wait for quite a while and click the refresh icon

Soon you will see another two instances automatically created.

Launch Instance Connect Actions									
Filter by tags and attributes or search by keyword									
<input type="checkbox"/>	Name	Instance ID	Instance Type	Availability Zone	Instance State	Status Checks			
<input checked="" type="checkbox"/>	WebServer	i-5ed950a1	t2.micro	us-east-1b	terminated				
<input checked="" type="checkbox"/>	WebServer	i-e7e67e37	t2.micro	us-east-1a	terminated				
<input type="checkbox"/>	Lab-NAT-t2-micro	i-757de4a5	t2.micro	us-east-1a	running	2/2 checks...			
<input type="checkbox"/>	WebServer	i-e4aa3d1b	t2.micro	us-east-1b	running	2/2 checks...			

It will take a bit longer for the instances to complete their start up checks and register with the ELB.

You can check status of this by going back to the load balancer screen and clicking the instances tab.

The status will change from OutOfService to InService.

The screenshot displays the AWS Management Console interface for a specific Elastic Load Balancing (ELB) instance. At the top, there's a 'Create Load Balancer' button and an 'Actions' dropdown. Below this is a search bar labeled 'Filter: Search Load Balancers'. A table lists the load balancers, with 'backspace-lab-elb' selected. The details for this load balancer are shown below, including its DNS Name, Port Configuration, Availability Zones, Instance Count (2), and Health Check (TCP:80). The 'Instances' tab is active, showing a table of instances. One instance is 'OutOfService' and the other is 'InService'. Both are 'WebServer' instances in the 'us-east-1a' availability zone. The 'OutOfService' instance has a 'Remove from Load Balancer' link next to it.

Instance ID	Name	Availability Zone	Status	Actions
i-fe50c701	WebServer	us-east-1b	OutOfService ⓘ	Remove from Load Balancer
i-ceec8a1e	WebServer	us-east-1a	InService ⓘ	Remove from Load Balancer

▶ Adding a Multi AZ RDS instance and Read Replica

In this section we will add a Multi-AZ RDS instance deployed across our two private subnets. We will need to create a DB Subnet across two availability zones to utilise Multi-AZ. We also will create a security group and update the WebServerSG security group to allow communication from the Web Server instances. We will then create a read replica in the second AZ.

First let's create a Security Group for our Aurora DB Cluster. We also need to add the security group to the WebServer security group's outbound rules.

Use the following rules for RDS and Web Servers:

DBServerSG: Recommended Rules

Inbound			
Source	Protocol	Port Range	Comments
The security group ID (sg-xxxxxxx)	All	All	Allow inbound traffic from instances assigned to the same security group.
The ID of your WebServerSG security group	TCP	3306	Allow web servers assigned to WebServerSG MySQL access to database servers assigned to DBServerSG
Outbound			
Destination	Protocol	Port Range	Comments
0.0.0.0/0	TCP	80	Allow outbound HTTP access to the Internet (for example, for software updates)
0.0.0.0/0	TCP	443	Allow outbound HTTPS access to the Internet (for example, for software updates)

WebServerSG: Recommended Outbound Rules

Outbound			
Destination	Protocol	Port Range	Comments
The ID of your DBServerSG security group	TCP	3306	Allow outbound MySQL Server access to the database servers assigned to DBServerSG

Go to Security Groups.

Copy the WebServer security group ID.

Click “Create Security Group”

Create an inbound MySQL TCP rule on port 3306 with source the WebServer security group ID.

Create Security Group

Security group name: DBServerSG

Description: DB Server Security Group

VPC: vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab

* denotes default VPC

Security group rules:

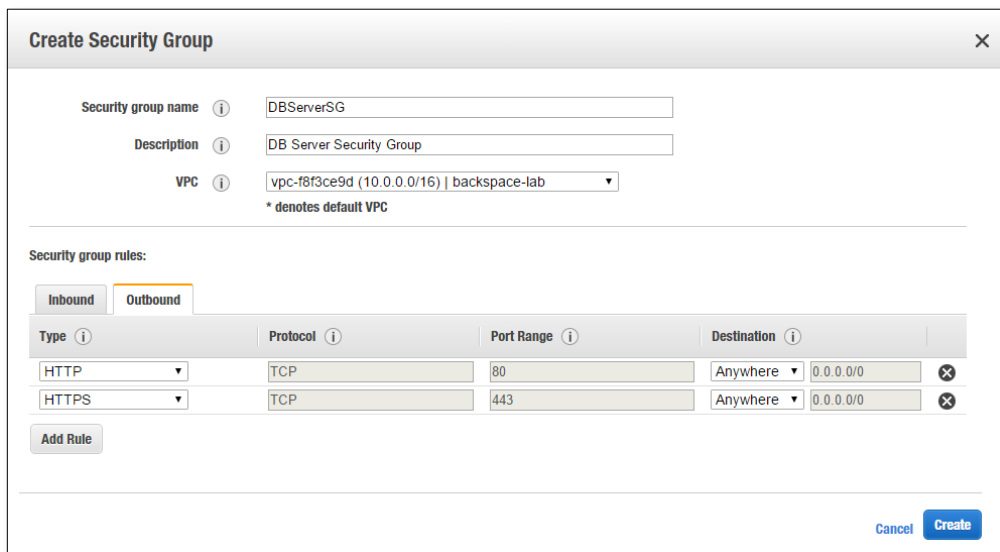

Inbound Outbound

Type	Protocol	Port Range	Source
MYSQL	TCP	3306	Custom IP sg-cc82bca8

Add Rule

Cancel Create

Create the outbound rules for ports 80 and 443.

Create Security Group

Security group name: DBServerSG

Description: DB Server Security Group

VPC: vpc-f8f3ce9d (10.0.0.0/16) | backspace-lab
* denotes default VPC

Security group rules:

Inbound | **Outbound**

Type	Protocol	Port Range	Destination
HTTP	TCP	80	Anywhere 0.0.0.0/0
HTTPS	TCP	443	Anywhere 0.0.0.0/0

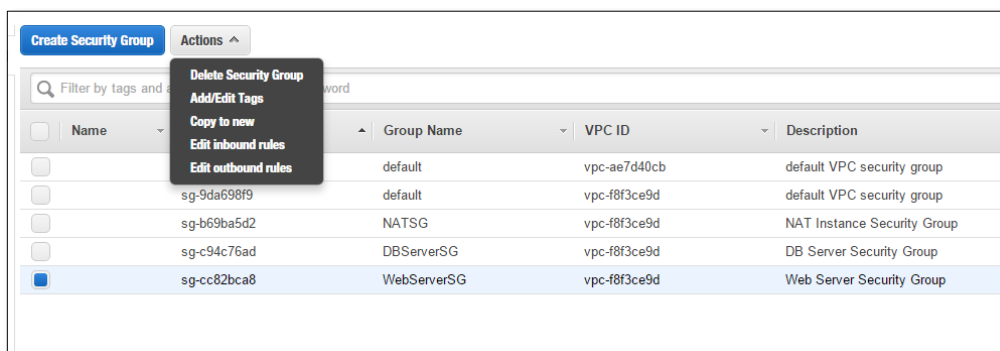

Add Rule

Cancel Create

Click Create

Now copy the newly created DBServerSG security group ID.

Now select and edit the outbound rules of the DBServerSG security group.

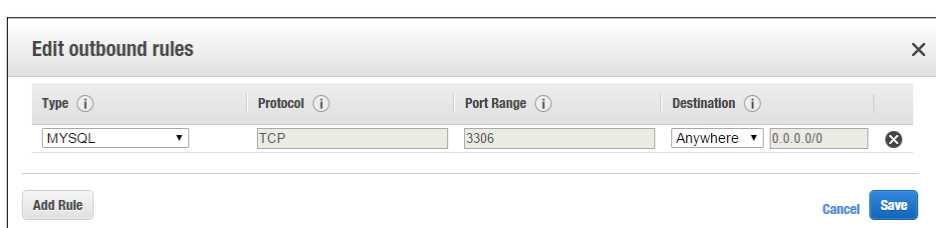

Filter by tags and search

Name	Group Name	VPC ID	Description
sg-9da698f9	default	vpc-ae7d40cb	default VPC security group
sg-b69ba5d2	default	vpc-f8f3ce9d	default VPC security group
sg-c94c76ad	NATSG	vpc-f8f3ce9d	NAT Instance Security Group
sg-cc82bca8	DBServerSG	vpc-f8f3ce9d	DB Server Security Group
sg-cc82bca8	WebServerSG	vpc-f8f3ce9d	Web Server Security Group

Actions:

- Delete Security Group
- Add/Edit Tag
- Copy to new
- Edit inbound rules
- Edit outbound rules

Create an outbound MySQL TCP rule on port 3306 with destination the DBServer security group ID.

Edit outbound rules

Type	Protocol	Port Range	Destination
MySQL	TCP	3306	Anywhere 0.0.0.0/0

Add Rule

Cancel Save

Click save

The last thing that you need before you can create an Aurora DB cluster is a DB subnet group. Your RDS DB subnet group identifies the subnets that your DB cluster will use from the VPC that you created in the previous steps. Your DB subnet group must include at least two subnets in at least two Availability Zones.

Go to the RDS Console.

Select the Subnet Groups page

Click create DB Subnet Group

Name the DB subnet group backspace-lab-subnetgroup

Select the backspace-lab VPC

Add the 10.0.1.0/24 private subnet 1

Add the 10.0.3.0/24 private subnet 2

Create DB Subnet Group

To create a new Subnet Group give it a name, description, and select an existing VPC below. Once you select an existing VPC, you will be able to add subnets related to that VPC.

Name ⓘ

Description ⓘ

VPC ID ⓘ

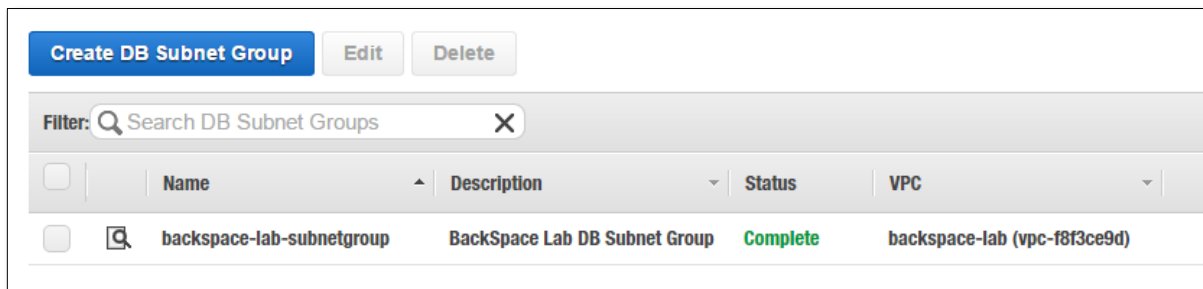

Add Subnet(s) to this Subnet Group. You may add subnets one at a time below or [add all the subnets](#) related to this VPC. You may make additions/edits after this group is created. A minimum of 2 subnets is required.

Availability Zone

Subnet ID

Availability Zone	Subnet ID	CIDR Block	Action
us-east-1b	subnet-6880e031	10.0.3.0/24	<input type="button" value="Remove"/>
us-east-1a	subnet-66d89411	10.0.1.0/24	<input type="button" value="Remove"/>

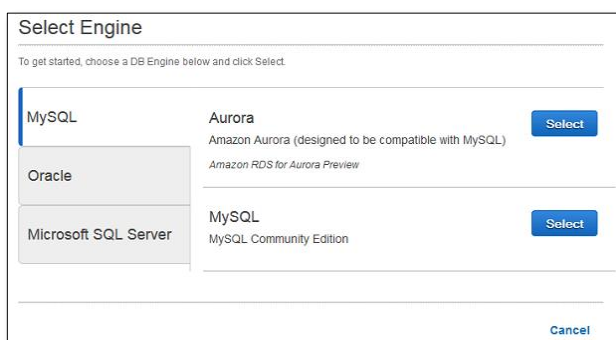

Click Create (you may have to click the refresh icon to see the subnet group)

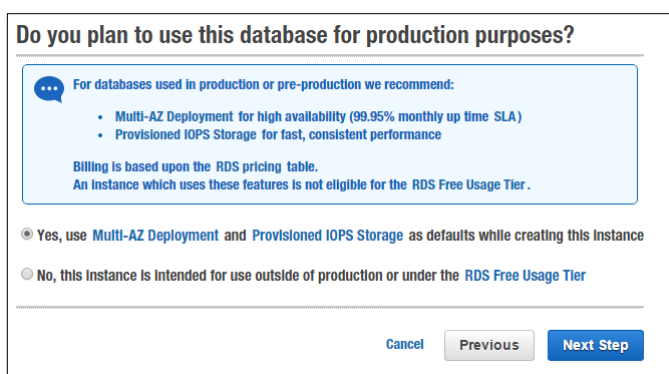

Go to the RDS Instances page

Click "Launch DB Instance"

Select one of the MySQL engines. Aurora at the time of writing is in preview and requires you to sign up beforehand. Aurora provides up to five times better performance than MySQL and will become the preferred option when fully released by AWS.

Select Yes for Multi-AZ deployment

Select a t2 micro instance size

Give the DB an identifier backspace-lab-db

Provide a username and password to use with the database.

Click Next

Specify DB Details

WebServerSG (VPC)

Database Options

Database Name backspace-lab

Note: if no database name is specified then no initial MySQL database will be created on the DB Instance.

Database Port 3306

DB Parameter Group default.mysql5.6 ▼

Option Group default:mysql-5-6 ▼

Enable Encryption No ▼

... The selected Engine or DB Instance Class does not support storage encryption.

Click Launch DB Instance

✓ Your DB Instance is being created.

Note: Your instance may take a few minutes to launch.

After quite some time the instance will be set up.

The screenshot shows the AWS Management Console interface for a MySQL DB instance. At the top, there are buttons for 'Launch DB Instance', 'Show Monitoring', and 'Instance Actions'. Below this is a search bar and a filter dropdown set to 'All Instances'. The instance 'backspace-lab-db' is selected, showing its VPC (vpc-f8f3ce9d), Multi-AZ status (Yes), Class (db.t2.micro), Status (available), Maintenance (None), Storage Type (General Purpose (SSD)), Storage (5 GB), and Security Groups. The 'Endpoint' is 'backspace-lab-db.c91ydkxchjop.us-east-1.rds.amazonaws.com:3306 (authorized)'. The 'Configuration Details' section includes Engine (MySQL 5.6.22), License Model (General Public License), Created Time (May 29, 2015 at 3:20:29 AM UTC+10), DB Name (backspace_lab), Username (backspace), Option Group (default:mysql-5-6 (in-sync)), and Parameter Group (default:mysql5.6 (in-sync)). The 'Security and Network' section shows Availability Zone (us-east-1a), VPC (backspace-lab (vpc-f8f3ce9d)), Subnet Group (backspace-lab-subnetgroup (Complete)), Subnets (subnet-6880e031, subnet-66d89411), Security Groups (DBServerSG (sg-19370d7d) (active)), Publicly Accessible (No), Endpoint (backspace-lab-db.c91ydkxchjop.us-east-1.rds.amazonaws.com), Port (3306), and Certificate Authority (rds-ca-2015 (Mar 5, 2020)). The 'Instance and IOPS' section shows Instance Class (db.t2.micro), Storage Type (General Purpose (SSD)), IOPS (disabled), and Storage (5 GB). The 'Encryption Details' section shows Encryption Enabled (No). The 'Availability and Durability' section shows DB Instance Status (available), Multi AZ (Yes), Secondary Zone (us-east-1b), Automated Backups (Enabled (7 Days)), and Latest Restore Time (May 29, 2015 at 3:20:29 AM UTC+10). The 'Maintenance Details' section shows Auto Minor Version Upgrade (Yes), Maintenance Window (tue:05:08-tue:05:38), Backup Window (06:42-07:12), and Pending Maintenance (None). At the bottom, there are buttons for 'Instance Actions', 'Events', 'Tags', and 'Logs'.

Here you can see the Instance Endpoint. This is the database endpoint that would be used in your Web Server instances WordPress configuration.

Now let's create a read replica in another availability zone to take some of the load off our master database. We can also promote this read replica to be the master in situations where we are having problems with the master database.

Click on Instance Actions at the bottom of the details and select Create Read Replica.

The screenshot shows the AWS Management Console interface for a MySQL DB instance named 'backspace-lab-db'. The instance details are similar to the previous screenshot, but the 'Instance Actions' dropdown menu is open, showing options: 'Modify', 'Reboot', 'Delete', 'Create Read Replica', 'Promote Read Replica', 'Take DB Snapshot', 'Restore to Point in Time', and 'See Details'. The 'Create Read Replica' option is highlighted. The instance details show the same configuration as before, but the VPC is 'vpc-c684bfa3' and the Subnet Group is 'backspace-lab-subnetgroup (Complete)'. The Subnets are 'subnet-1c1d7445' and 'subnet-f3481d84'. The Security Groups are 'DBServerSG (sg-75c1da11) (active)'. The Endpoint is 'backspace-lab-db.c91ydkxchjop.us-east-1.rds.amazonaws.com'. The Port is '3306'. The Certificate Authority is 'rds-ca-2015 (Mar 5, 2020)'. The 'Instance Actions' button is highlighted at the bottom.

Name the replica backspace-lab-replica

Select availability zone us-east-1b.

Create Read Replica DB Instance

You are creating a replica DB Instance from a source DB Instance. This new DB Instance will have the source DB Instance's DB Security Groups and DB Parameter Groups.

If you look at the endpoints for both instances they are different. This creates a problem for our Wordpress application that is launched in Multi-Azs. The application will not know which endpoint to use.

You may think that we can just add an internal ELB in front of our RDS instances as we have done with our WordPress EC2 instances and then reference the ELB endpoint. Unfortunately this is not possible with AWS as you can only front EC2 instances with an ELB not RDS instances.

There are two solutions to the problem:

1. Create a HAProxy instance in front of our RDS instances and use this to serve traffic to our RDS instances. You can then reference the endpoint for the HAProxy instance. This is the preferred solution of AWS. Implementing this is beyond the scope of the Architect Associate level but you still need to be aware of it as a solution.
2. Create a script that checks the EC2 instance metadata on startup to identify the availability zone. The Wordpress application will then be able to use the correct endpoint for the availability zone it is launched into. Implementing this is again beyond the scope of the Architect Associate level.

🔍 Finishing up the lab

Now that you have completed the lab, make sure that you stop or terminate all the EC2 and RDS instances so that you don't get billed for them.

You will first need to delete (using the console) or suspend (using the CLI) the auto scaling group otherwise the EC2 instances will be launched again after termination.
